Remote Data Logging : on-line & real time

Caption Data launches new HygroNet™ SOLO product – a unique internet enabled temperature and humidity monitor

September 2010

Saving time and money, while cutting down on wasted travel and raising capacity are just some of the benefits behind the HygroNet™ Solo product. You may not be able to be in two places at once, but now you can monitor data from more than two places at once!

A development from the original HygroNet™ product, the all new Solo offers the same data monitoring possibilities but from an individual, self powered, “out of the box” system at entry level pricing, that offers superb return on investment.

The HygroNet Solo is available in two models:-

Ambient temperature/humidity.

Ambient temperature/humidity, plus ‘in wall’ temperature/humidity (ERH) and WME.

Whatever the options selected, data is monitored at user defined frequencies ranging from seconds to days, and transmitted via the mobile phone network to the HygroNet™ secure server from where the customer can download trend data from any internet enabled device, be it computer, laptop or smart phone! SMS alarms are a feature of the product too, allowing you to be warned when preset conditions are met and targets for your drying goals.

No more wasted trips to site to monitor building conditions, just fit a HygroNet Solo and monitor the results. Insurance companies are increasingly specifying remote monitoring and forward thinking business in the damage restoration business have identified the benefits from accessing quality data, real time and on line, to manage their portfolio of restoration work..
